Appendix A - DSM Analysis Results

DEMAND-SIDE ANALYSIS

Overview

Montana-Dakota recognizes the value that Demand-Side Management (DSM) can play in meeting its customer's future energy requirements with the growing demand for electricity and the need for additional supply-side resources. However, the implementation of DSM programs cannot be done without cost consideration to the customers and the Company's shareholders. Interests need to be balanced to achieve results at an affordable cost to both the utility and its customers. Montana-Dakota has focused on a defined list of DSM programs that are best suited for the Company's load shape.

Montana-Dakota's DSM analysis is completed on a state by state approach (Montana, North Dakota, and South Dakota) versus an Integrated System approach, due to the complexities of offering DSM programs across multiple jurisdictions and then in total for the Integrated System. The true value of DSM can only be achieved as an integrated resource implemented across all jurisdictions; however, cost recovery is necessary in each jurisdiction for full implementation to occur. In some cases, particularly in the case of demand response programs, the cost of infrastructure is such that if full system implementation is not achieved, the program may not be feasible.

Energy Efficiency

Provided in this Attachment is a detailed discussion of Montana-Dakota's demand-side analysis and approach. In order to fully implement any of the described programs, Montana-Dakota will seek, and must have, regulatory approval and cost recovery.

In the 2013 IRP Montana-Dakota provided the results of the Nexant Energy Efficiency Potential Study that was completed for the Montana service territory, which also included an energy efficiency attitudes survey of customers. In addition, Montana-Dakota provided the results of the Nexant Program Planning Study for the Montana Service territory in the 2015 IRP. Montana-Dakota continues to use the key findings of both studies in our DSM planning process for the 2021 IRP.

Based on the results of the Montana study and Montana-Dakota's market knowledge of the service territory Montana-Dakota estimates the achievable annual energy reduction of 0.34 percent of annual energy sales (MWh) and 1.78% of demand (MW) savings in 2040.

The Montana service territory achievable potential identified in the Nexant Study was used to project the savings that could be achievable in Montana. The achievable potential is estimated to be 0.25 percent of energy sales in Montana over the IRP planning period. Table B-1 contains the estimated achievable potential for the Montana service territory.

The Montana service territory achievable potential identified in the Nexant Study was used as a basis to project the savings that could be achievable in North Dakota. The achievable potential is estimated to be 0.38 percent of energy sales in North Dakota over the IRP planning period. Table B-2 below contains the estimated achievable potential for the North Dakota service territory.

The Montana service territory achievable potential identified in the Nexant Study was used to project the savings that could be achievable in South Dakota. The achievable potential is estimated to be 0.25 percent of energy sales in South Dakota over the IRP planning period. Table B-3 contains the estimated achievable potential for the Montana service territory.

Montana-Dakota understands that these goals are lower than national averages for achievable potential; however, based on the results of the Montana service territory study, the small rural customer base, and limited contractor networks, Montana-Dakota feels these targets are appropriate.

Demand Response

As discussed later in this Attachment, Montana-Dakota continues to pursue a demand response portfolio that includes a Commercial Demand Response Resources (DRR) Program and the Company's current Interruptible Demand Response rates. These two programs at year end 2020 combine to offer approximately 40.4 MW of demand response to Montana-Dakota's integrated system. The demand response goal from the two programs is 45 MW by 2021 or 7.6 percent of the total forecasted Integrated System peak demand in 2021. In 2020 Montana-Dakota expanded the DRR program to a target enrollment of 50 MW, with an initial target enrollment of 40 MW by 2023. This brings the total demand response goal for the two programs to 60 MW by summer 2023.

DSM Program Overview

Montana-Dakota currently offers Energy Efficiency DSM Programs only in the company's Montana service territory. These programs are funded through the Universal Systems Benefit Charge. Demand Response DSM Programs are available to commercial customers in Montana, North Dakota, and South Dakota.

The following is an overview of program details associated with the portfolio of DSM measures currently being offered or considered for implementation. The overview provides a description of the program, jurisdictions where the program is or will be offered, DSM measures included in the program, incentive levels, and the marketing and promotion plan.

Residential LED Lighting Program

This program offers rebates to Montana-Dakota residential customers when they purchase and install LED lighting versus incandescent and compact fluorescent lighting (CFL) in single family dwellings. The program is available to existing customers and new construction.

The program provides a rebate on a per bulb basis (limited to 40 bulbs per residential electric account) and is available as a mail-in rebate application form.

Program Incentive:

Measure	Incentive Level
Residential LED Lighting (A-line, 40W, 60W 75W and 100W equivalent)	50% of bulb or package cost not to exceed \$5 per bulb
Residential LED Lighting (Globe, Indoor Flood and Outdoor Flood)	50% of bulb or package cost not to exceed \$7 per bulb

Montana-Dakota will effectively market the program through the following:

- Website and social media
- Bill inserts
- Online advertising and billboards

Company-owned Lighting LED Conversion

In 2017, Montana-Dakota began a LED conversion project of its company-owned lighting (streetlights, flood lights and yard lights). Street Lighting and flood lighting conversion projects have been completed across the company's service territory and the yard lighting conversion is nearing completion. The estimated annual energy savings for Montana-Dakota's integrated electric system associated with these projects is approximately 16,259,000 kWh.

Commercial Lighting Program

The Commercial Lighting program offers an array of prescriptive rebates to capture most of the common retrofit lighting applications. The prescriptive rebate levels are individually designed to maximize customer participation and cost effectiveness. The program also includes rebates for lighting controls and occupancy sensors that will minimize runtimes. A custom lighting efficiency option also offers rebates for projects that are non-prescriptive, however most applications should be covered in the prescriptive program.

This program is available to Montana-Dakota's commercial customers that are served under a general service electric tariff.

Incentive levels are specific to the prescriptive application and first year energy savings for the custom efficiency projects and customer rebates are capped at 50% of the equipment cost. The

benefit cost modeling for this program assumes the average customer rebate level will be \$0.09 per kWh saved.

Montana-Dakota will market the program through the following:

- Company Website
- Key account representatives

Commercial Partnership Program

This program offers rebates to Montana-Dakota's commercial and industrial customers installing energy conservation measures that are not eligible under the prescriptive rebates due to the variability in the energy savings and cost of the project. Rebates are based on the amount of energy savings, and the project must pass the Total Resource Cost test (TRC) with a Benefit/Cost ratio greater than one. This program is available to Montana-Dakota's general service electric customers in Montana.

The commercial partnership program is designed to lower the initial cost of a variety of energy-efficient upgrades that are not available for any of the prescriptive rebates. While the incentive levels for this program are project specific, other criteria under this program are:

- Equipment installed must be more efficient than the industry standard,
- Simple payback must be greater than 1 year,
- Rebate cannot exceed 50 percent of the incremental cost of the equipment,
- Rebate will be based on the amount of energy and demand saved,
- Weatherization is not eligible for a rebate,
- Distributed renewable generation such as solar and wind under 50 kW will be considered under a net metering arrangement,
- Additional measurement and verification of the energy savings maybe required; and
- Rebate is also available to new construction.

The incentive levels for this program will be project specific. Montana-Dakota will market the program through the following:

- Website
- Key account representatives
- HVAC contractor relationships

Commercial Demand Response Resources (DRR) Program

The Commercial DRR Program was launched in June of 2012 and is offered to commercial and industrial electric customers with a load of 50 kW or higher, with a priority focused on customers with loads of 150 kW or higher. This program is administered by a third-party demand response aggregator under contract with Montana-Dakota. The third-party aggregator is responsible for customer enrollment, settlement, and administration of the program on behalf of Montana-Dakota. This program is available to commercial and industrial electric customers in Montana, North Dakota, and South Dakota. In 2020, Montana-Dakota expanded the DRR program to include provisions to enroll commercial customers with a load of 25 kW or higher, and expand the target enrollment to 50 MW, with an initial target enrollment of 40 MW by 2023.

The program applies to commercial and industrial electric customers who agree to shed non-critical load during a demand response event initiated by Montana-Dakota. The program provides for a one-hour notification of an event, with a four-hour maximum event period, and up to 50 hours per year.

Participating customers will receive a capacity and energy payment for participating in the program, and payment amounts will be pursuant to a negotiated contract between the customer and the third-party aggregator, who is marketing the program on behalf of Montana-Dakota.

Montana-Dakota promotes the program with support from the third-party aggregator's marketing and promotion efforts through the following:

- Key account representatives,
- Website,
- Webinars,
- Direct Mail and Email.

Interruptible Demand Response Rate

The Interruptible Demand Response Rate has been available for several years and is offered to commercial and industrial electric customers with loads of 500 kW or higher. This program is administered by Montana-Dakota and the rate is offered as an optional rate for customers to consider for their power service. The rates reflect a discounted demand charge in exchange for the load being available to call upon for reduction during demand response events. This program is available to commercial and industrial electric customers in Montana and North Dakota.

The program applies to commercial and industrial electric customers who agree to shed their entire load during a demand response event initiated by Montana-Dakota. The program provides for a one-hour notification of an event, with no maximum event time period, and up to 100 hours per year.

Montana-Dakota's marketing and promotion efforts are primarily through the following:

- Key account representatives,
- Website.
- Architect and engineering contractors.

DSM Methodology

In order to balance all interests and achieve cost-effective DSM for customers and utility shareholders, a cost-benefit analysis from different perspectives was performed on potential DSM measures. The perspectives or "tests" are not intended to be used individually or in isolation, rather they must be compared to each other. This multi-perspective approach will allow consideration of tradeoffs between the various tests. However, the impacts measured from the Total Resource Cost Test will necessarily determine if a program is economically feasible. Once a program is determined feasible, all other test results are considered to determine if a program is to be implemented.

Therefore, even if a program is feasible it may not be implemented due to tradeoffs with other tests and other identified factors.

Benefit/Cost Analysis

Montana-Dakota used a Microsoft Excel© spreadsheet-based model (Montana-Dakota DSM Model) to run benefit/cost analyses for each considered DSM program. The basic function of this evaluation tool is to calculate each DSM program's benefits and costs over its projected life on a discounted cash flow basis and determine its cost effectiveness on a stand-alone basis. The programs were evaluated using five different cost-effectiveness tests:

- <u>Participant Test</u> considers the economic impact of a program on the participating customers,
- <u>Utility Test</u> considers the impact on the utility,
- <u>Societal Cost Test</u> includes environmental externalities and considers the impact on the

- "society" (both the participating and non-participating customers),
- <u>Ratepayer Test</u> includes quantifiable benefits and costs of a given program and considers its impact on ratepayers, and
- <u>Total Resource Cost Test (TRC)</u> reflects the total benefits and costs to all customers (both the participants and non-participants).

For each test, the merits of the DSM program are evaluated based on the net present value (NPV) of the annual benefits and costs over the analysis horizon. The NPV calculation is based on the discount rate associated with each test and assumes the cash flows occur at the end of the year. The following section explains the process of evaluating the programs from each of the five perspectives.

Participant Test

The Participant Test is a measure of the quantifiable benefits and costs brought about by a customer's participation in a DSM program. For purposes of evaluating the merits of a DSM program, quantifiable benefits include any incentives received by a participant and the reduction in a participant's electric bill through reduced energy use and/or demand. Quantifiable costs include any costs the customer incurs in order to participate in a DSM program, such as increased appliance costs or the availability of a back-up fuel source. The NPV calculation is based on the participant discount rate. The participant net benefit is calculated by the following equation:

```
Net Benefit = Total Annual Benefits - Total Annual Costs

where

Total Annual Benefits = Energy Savings (kWh)
+ Demand Savings (kW)
+ Incentive
+ Other Savings

Total Annual Costs = Direct Costs + Other Costs
```

A benefit/cost ratio greater than one for the Participant Test indicates the DSM program will result in savings to the participant over the life of the program.

Ratepayer Test

The Ratepayer Test is a measure of the quantifiable benefits and costs the utility incurs as a result of customer participation in a DSM program. For purposes of evaluating the merits of a DSM program, quantifiable benefits include any reduction in purchased power costs due to decreased

customer energy and demand, along with a reduction in variable operation and maintenance costs. Quantifiable costs to the utility include incentive and administrative costs, along with the loss of electric margin due to reduced sales. The NPV calculation is based on the utility discount rate. The utility net benefit is calculated by the following equation:

```
Net Benefit = Annual Cost of Energy Saved – Annual Project Costs

where

Annual Cost of Energy Saved = Energy Savings (kWh)*
+ Peak Demand Savings (kW)*
+ O&M Savings

Annual Project Costs = Total Project Costs + Lost Margin

*kWh and kW savings include losses and reserve requirement savings.
```

A benefit/cost ratio greater than one for the Ratepayer Test indicates the DSM program will reduce overall rates.

Societal Cost Test

The Societal Cost Test measures the net costs of a DSM program as a resource option based on the total costs of the program (both the participants' costs and the utility's costs). This test also includes a factor for environmental externalities, which for this analysis is based on a \$30/ton cost of carbon dioxide (CO₂). This test is a summation of the benefit and cost terms in the Participant Test and the Ratepayer Test. The NPV calculation is based on the societal discount rate. The total cost net benefit is calculated by the following equation:

```
Net Benefit = Annual Cost of Energy Saved – Annual Project Costs

where

Annual Cost of Energy Saved = Energy Savings (kWh)*
+ Demand Savings (kW)*
+ O&M Savings
+ Avoided Environmental Damage
Annual Project Costs = Total Project Costs
```

*kWh and kW savings include losses and reserve requirement savings.

A benefit/cost ratio greater than one for the Societal Cost Test indicates the DSM program is cost effective to both the utility and its ratepayers on a societal cost basis.

Utility Test

The Utility Test is a measure of the quantifiable benefits and costs placed on ratepayers due to changes in the utility's revenues and operating costs as a result of the DSM program. The Utility test includes the same benefits and costs as the Ratepayer Test, except the quantifiable costs exclude lost margin. The NPV calculation is based on the utility discount rate. The ratepayer net benefit is calculated by the following equation:

```
Net Benefit = Annual Cost of Energy Saved – Annual Project Costs

where

Annual Cost of Energy Saved = Energy Savings (kWh)*
+ Demand Savings (kW)*
+ O&M Savings

Annual Project Costs = Total Project

*kWh and kW savings include losses and reserve requirement savings.
```

A benefit/cost ratio greater than one for the Utility Test indicates the cost of energy saved is greater than the cost of saving the energy.

Total Resource Cost Test (TRC)

The Total Resource Cost Test (TRC) reflects the total benefits and costs to all customers (participants and non-participants) in the utility service territory. The key difference between the TRC and utility test is that the TRC does not include program incentives, which are considered zero net transfers from a regional perspective. Instead, the TRC includes the net measures costs and net avoided costs. The NPV calculation is based on the utility discount rate. The total cost net benefit is calculated by the following equation:

```
Net Benefit = Annual Cost of Energy Saved – Annual Project Costs

where

Annual Cost of Energy Saved = Energy Savings (kWh)*
+ Demand Savings (kW)*
+ O&M Savings

Annual Project Costs = Total Project Costs net of incentive costs

*kWh and kW savings include losses and reserve requirement savings.
```

A benefit/cost ratio greater than one for the TRC Test indicates the DSM program is cost effective to all customers, both participating and non-participating.

Montana-Dakota evaluated each program's feasibility based on the results of the TRC Test. If the benefit/cost ratio for the TRC Tests were greater than one, the DSM program(s) are considered feasible and will be further evaluated.

DSM Model Input Data

Montana-Dakota's DSM Model is dependent on the input data to determine the cost-benefit of each program. Recent Company operational and financial data is used for the general model data inputs, and estimated supply cost avoidance is used based on marginal energy costs and capacity costs of adding the next supply resource including reserve requirements and losses. Program specific data is also used for each program being evaluated. The operational, financial, and program data inputs used for each program model run are provided in Appendix A to this Attachment, and sources of the data are shown in Table B-4.

Also shown in Table B-4 are the inputs for avoided system energy costs and capacity costs applicable to the DSM measures. Avoided energy costs are based on the system marginal energy cost that is projected for the next 10 years and escalated by 0.06 percent annually thereafter. The avoided capacity costs are based on the estimated levelized cost of a combustion turbine. These costs are the same across all three states in Montana-Dakota's Integrated System. The retail energy rate and demand costs vary across the states and are based on the average cost for much of the rate class to which the DSM measure is applicable.

DSM Model Results

Based on the methodology and data inputs discussed above, a portfolio of programs was developed for Montana, North Dakota, and South Dakota. The complete DSM Model runs for each state and each program are provided in Appendix A to this Attachment, and a summary by state of the cost-benefit ratios is shown in Tables B-5 (Montana), B-6 (North Dakota), and B-7 (South Dakota).

Montana-Dakota Utilities Co. Montana Electric DSM Program Summary Table B-5

Benefit/Cost Ratios						
	Customer					Total
DSM Program	Class	RIM	Utility	Societal	Participant	Resource Cost
Total Portfolio		1.97	2.58	3.43	7.16	2.39
Residential Programs

Montana-Dakota Utilities Co. South Dakota Electric DSM Program Summary Table B-7

Benefit/Cost Ratios						
	Customer					Total
DSM Program	Class	RIM	Utility	Societal	Participant	Resource Cost
Total Portfolio		1.80	2.50	3.35	5.14	2.12
Residential Programs						
Residential Lighting	Residential	0.52	1.78	1.79	3.05	1.06
Commercial Programs						
Commerical Lighting	Commerical	1.96	5.31	7.73	6.82	3.50
Commercial Partnership Program (Custom)	Commercial	1.56	3.48	3.61	4.74	2.08
Demand Response						
Commercial Demand Response Program	Commercial	2.07	2.07	2.81	4.98	2.00
Interruptible Rate DR Program	Commercial					

The overall results show that the programs are cost effective at the measure, segment, and portfolio level in each state based on the TRC test. However, the residential lighting program does not pass the RIM test in North Dakota and South Dakota. This can be attributed to the environmental adder that is required in Montana and included in the Montana benefit cost analysis.

Technical Reference Manual (TRM)

The underlying demand-side resource program designs and evaluation criteria, cost information, and other assumptions that are particular to the programs studied vary by program. Much of the information is derived from the Minnesota Technical Resource Manual (TRM) that was developed for the state by Franklin Energy, with input from the state and various stakeholder groups, and is used by utilities in Minnesota as part of their Conservation Improvement Programs. The Minnesota TRM was adjusted to reflect weather data specific to Montana-Dakota's service territory. Utilizing the TRM allows Montana-Dakota to use a deemed savings approach to evaluation, measurement, and verification (EM&V) for prescriptive measures. The deemed savings approach to EM&V allows Montana-Dakota to keep administration costs low while providing an appropriate level of verification for prescriptive measures.

This TRM uses generally accepted engineering algorithms, along with developed operating data to determine the savings of each DSM measure. Along with the calculations, other program parameters are defined. The parameters include baseline efficiency standards, high-efficiency standards, incremental costs, and peak demand factors.

Montana-Dakota's prescriptive lighting program utilizes Wisconsin's TRM. Wisconsin's TRM was developed for the state by The Cadmus Group, Inc. and is used in Wisconsin's Focus on Energy conservation programs. Montana-Dakota chose to use Wisconsin's TRM to support our prescriptive lighting program because the Wisconsin TRM has a robust catalog of lighting measures and really focuses on providing baseline values for many of the variables in the algorithms. Montana-Dakota felt the more robust Wisconsin TRM lighting algorithms would result in a more accurate energy savings calculation than the lighting measures in the Minnesota TRM.

Appendix A DSM Benefit/Cost Analysis

Additional Technical Notes

*Average kW savings per season is base on total kW saved & allocated to season based on normal usage patterns of the technology. (i.e. AC summer only, motors 4 months summer & 8 months winter)

|**Air Conditioning tune-up, consisting of computerized diagnostic and refrigerant charge / air flow corrections
